

Shaping the Bench: The Effect of Ideology and Performance on Judicial Reappointments

Silje Synnøve Lyder Hermansen

Daniel Naurin

December 22, 2024

Abstract

Judicial appointments allow selectors to advance policy goals by appointing influential judges who share their ideological preferences. Under renewable terms, information from judicial records becomes crucial for identifying desirable candidates. While prior research has focused on judicial voting, we examine how expectations about judges' influence on case law shape reappointments. Using original data on all potential reappointments to the Court of Justice of the European Union (CJEU), we show that governments select judges based on both ideology and potential impact. Secret voting – intended to safeguard judicial independence – fails to shield judges from ideological deselection. However, reappointment levels remain high because governments recognize the need to translate preferences into policies. Peer selection to influential court positions thus favors the reappointment of high-performing judges, while non-selective processes do not. Our findings challenge the belief that renewable terms weaken judicial independence, showing that selectors indirectly rely on peer evaluations for reappointments.

Introduction

Judicial independence and responsiveness are central democratic principles (Ferejohn et al., 1999; North and Weingast, 1989), and rules governing judges’ appointments aim to balance these goals (Larsson, Squatrito, et al., 2022; Tiede, 2022; Gibson and Nelson, 2022; Kritzer, 2020; Melton and Ginsburg, 2014; Garoupa and Ginsburg, 2009; Hayo and Voigt, 2007). However, a court’s internal organization can profoundly affect this balance, even when appointment rules remain unchanged. This article examines how the availability and relevance of information provided by courts shape judicial (re)appointments.

We argue that selectors advance their policy goals by appointing influential judges who share their ideological preferences. When terms are renewable, judicial records become crucial for identifying desirable candidates, as they help selectors assess the uncertain link between judges’ qualities and their influence over case law. We demonstrate that secret voting, while protecting judicial independence (Dunoff and Pollack, 2017), does not shield judges from ideological deselection. Absent new information, selectors simply rely on their prior beliefs about judges’ preferences. We also show that records on peer selection for key court positions provide essential information about which judges shape case law, allowing candidates with suboptimal preferences to compensate through higher potential impact.

Renewable terms are common across U.S. state supreme courts (Geyh, 2019, p. 47) and international judiciaries (Dunoff and Pollack, 2017). In 2014, 17 of 24 international courts permitted judges to seek reappointment (Squatrito, 2018). Yet, research on judicial appointments remains limited compared to studies of judicial behavior. While some scholars focus on immutable qualities like ideology and expertise (i.e. adverse selection)(Cameron, Cover, and Segal, 1990; Epstein and Segal, 2005; Elsig and Pollack, 2014; Cameron, Kastellec, and Mattioli, 2023), others highlight how judges adjust decisions to avoid deselection (i.e. moral hazard) (Gray, 2017; Gray, 2019; Shepherd, 2009a; Shepherd, 2009b; Canes-Wrone, Clark, and Kelly, 2014; Dunoff and Pollack, 2017; Stiansen, 2022). Contrary to the view that

renewable terms serve only as a sanctioning tool (Ferejohn et al., 1999), we propose that reappointments are forward-looking (Fearon, 1999) but informed by judicial records. While prior work emphasizes behavioral incentives for judges, we instead explore institutional incentives for governments to act on courts' organizational decisions.

The shift in focus sheds new light on judicial recruitment. First, variation in reappointment rates when information on performance is available reveals how beliefs about judges' influence shape recruitment. Personal standing, bolstered by seniority norms or peer recognition, is instrumental to judges' influence in collegial courts. If reappointments were driven solely by ideology, selectors would replace any judge whose preferences deviate from their own. However, judges often retain office despite shifts in selectors' preferences (e.g., after an election), as those with strong personal standing help selectors achieve policy goals. Selectors may therefore accept some policy drift to balance ideology with impact.

Second, information matters to selectors only when it predicts future judicial impact rather than simply documenting past behavior. Records of case assignments or leadership roles are valuable when they reflect a judge's personal qualities. Conversely, such records are irrelevant if assignments are random or administrative, as any new judge could also obtain them. Thus, information about judges' records may influence reappointment in some cases but not others, depending on court procedures.

To test our argument, we study the Court of Justice of the European Union (CJEU or the Court). Judges are appointed by the governments of EU Member States for six-year renewable terms, yet the Court is widely regarded as exceptionally independent (Pollack, 2003; Alter, 2009). Secret deliberations and votes safeguard this independence (Dunoff and Pollack, 2017), but the Court also reintroduces accountability by providing selectors with information about judges' roles in decision-making processes (Hermansen, 2020).

The institutional features of the CJEU have broad generalizability. Like many collegial courts in Europe and the Americas, it delegates case preparation to a single judge (the

”reporting judge”), akin to the majority opinion writer in the U.S. Supreme Court (K. Kelemen, 2016). These roles exemplify a judge’s ability to influence their peers and shape the Court’s jurisprudence. By 2011, the CJEU model had inspired 11 other international courts (Alter, 2014), cementing its significance as a template for judicial institutions worldwide.

Moreover, the CJEU provides critical variation for research design. The Court comprises two levels: the Court of Justice (CJ) and the General Court (GC). In the CJ, cases are allocated selectively to individual judges, while the GC relies on more administrative procedures. Leadership selection has also shifted over time, moving from a rotational system to peer elections. As a result, judges’ records of service sometimes offer relevant information to selectors—and sometimes do not.

Finally, the stakes of judicial appointments at the CJEU are high. As the EU’s highest court, it interprets EU law for a bloc of 450 million people—the world’s third-largest economy—across diverse policy areas, including market regulation, competition, monetary policy, migration, and environmental protection. Its decisions shape the constitutional development of the EU and frequently challenge Member State policies (Weiler, 1994; Stone Sweet, 2004). Yet, while Member States fiercely guard their prerogative to unilaterally nominate judges (Dehousse, 2016), scholars argue that appointing a single judge provides governments with only limited influence (Alter 2008, p. 46; see also R. D. Kelemen 2012).

Our findings have significant implications for how governmental preferences interact with courts’ institutional design to shape the bench. Analyzing 268 reappointment decisions from the Court’s 70-year history (1952–2021), we show that renewable terms foster responsiveness in two ways. First, judges are selected for their preferences. The Court’s composition is continuously updated to reflect the economic left-right ideology of successive ruling majorities in EU Member States. A shift in government during a judge’s term significantly reduces their chances of reappointment.

Second, judges may be held accountable for their performance, but this depends on the

Court’s internal organization. Incumbent judges with many selective positions of influence are more likely to be reappointed, whereas non-selective positions have no impact on their job security. As a result, renewable terms, combined with transparency about judicial performance, make selectors reliant on the Court itself to assess incumbent candidates (see also, Krenn, 2022, p. 202).

Importantly, we find no evidence that the effect of performance is conditional on ideology, as would be expected if appointments were based on political spoils. This aligns with our assumption that selectors are policy-seekers who recognize the futility of retaining a low-performing party loyalist. It also explains the high reappointment rate (73%) at the CJEU: replacing an experienced judge with a newcomer entails an opportunity cost, as the latter may require years to develop comparable standing.

Our study sheds light on how selectors’ expectations about judges’ future influence shape judicial appointments. In the US, scholars have theorized that the Supreme Court’s reliance on a majority opinion writer means “that even ‘lesser’ judicial appointments can affect legal policy” (Lax and Rader, 2015, p. 661). Expectations about the qualities required for such positions should, in turn, influence appointments to the bench (Cameron, Kastellec, and Mattioli, 2023), but evidence for this link has remained elusive. To address this gap, we show that expectations about the European equivalent of the majority opinion writer—the reporting judge—play a critical role in shaping reappointment decisions.

A fruitful path forward is to shift research from asking *whether* expertise matters for judicial nominations to examining *how* judges sway their peers. While US scholars have linked legal experience to ideology as a form of “policy reliability” (Cameron, Kastellec, and Mattioli, 2023), students of international courts have debated whether governments perceive judges as policy agents or expert trustees (Elsig and Pollack, 2014; Alter, 2008). Our findings suggest that governments seek to pair ideology with expertise, but this pairing depends on whether legal qualifications also yield policy gains.

Selecting judges to international and domestic high courts

Judicial appointments provide the political branch with a crucial opportunity to shape case law (Dahl, 1957; Segal and Spaeth, 2002). While the role of ideology in judicial selection is well-studied, there is limited research on how selectors consider judges' potential influence over court decisions.

Most of the literature focuses on the United States, where selectors' political preferences are regarded as the main driver of judicial appointments. This influence often leads state court judges to strategically adjust their rulings to align with selectors' preferences in order to retain office or secure promotion (Gray, 2017; Gray, 2019; Shepherd, 2009a; Shepherd, 2009b; Canes-Wrone, Clark, and Kelly, 2014; Black and Owens, 2016). When judges' independence is guaranteed by lifetime appointments, candidates' ideological alignment with selectors is central (Epstein and Segal, 2005; Cameron, Cover, and Segal, 1990; Binder and Maltzman, 2009; Bonica and Sen, 2020). According to the move-the-median theory, successful judicial nominees must shift the court's median closer to the US President's preferences while remaining ideologically moderate enough to gain Senate support (Krehbiel, 2007; Moraski and Shipan, 1999). Since court decisions rely on majority voting, appointments are seen as pivotal for court decisions only when they alter the median voter on the bench.

Recent empirical studies, however, highlight two important deviations from these predictions. First, appointed judges are sometimes more or less extreme than anticipated, suggesting that their selection may hinge on additional factors (Cottrell, Shipan, and Anderson, 2019); see also (Bailey and Spitzer, 2018). Second, scholars note that case delegation to majority opinion writers allows judges other than the median to wield disproportionate influence over court policies (Lax and Rader, 2015). This raises a critical question: how do expectations about future majority opinion writers influence judicial appointments?

If candidates can compensate for their ideological distance with the promise of impacting the court's decisions, this may explain anomalies in the choice of Supreme Court judges.

What qualities should judges exhibit to persuade the US President of their future influence on the bench? Cameron, Kastellec, and Mattioli (2023, p. 209-236, 446) introduce "policy reliability" as an additional criterion. They argue that candidates with a legal career leave a paper trail that reduces the variance in the outcome of their rulings; such candidates' rulings are more predictable. In the authors' argument, the emphasis on reliability emerges endogenously from the President's policy-seeking goals, just as ideology does: "presidents value nominee ideology to the extent, and only to the extent, it has an impact on the policies the court creates" (p. 214). The authors further distinguish a candidate's reliability from their legal expertise, which the US President and/or senators simply view as an intrinsic quality (Epstein and Segal, 2005; Cameron, Cover, and Segal, 1990).

Why would expertise not also be theorized as a strategic asset when judges are nominated? While expertise is inherently important for high-quality legal reasoning, it can also serve as a strategic tool for achieving policy goals. The case-space model, for example, posits that the legal quality of a proposed judgment may induce other judges to vote for outcomes they would otherwise oppose (Lax and Cameron, 2007). Expertise, therefore, could influence judicial outcomes alongside ideology.

Yet, evidence linking legal expertise to judicial appointments outside the US Supreme Court remains mixed (Epstein, Knight, and Martin, 2003; Choi, Gulati, and Posner, 2015; Cameron, Kastellec, and Mattioli, 2023). Some scholars argue that selectors may discount expertise when acquiring such information is costly or when the political rewards of an appointment are too low (Cameron, Kastellec, and Mattioli 2019, 471–472; Choi, Gulati, and Posner 2015, 129–130). This article does not focus on expertise, but we propose that variations in how judges gain influence within the court shape the selection criteria used during judicial appointments.

The literature on international courts – though less developed than its American counterpart – mirrors similar debates. Legal academics have proposed merit selection committees

to reduce the cost of screening for competence (Bobek, 2015). However, observers question whether states would commit to expertise-based selections if it risks policy drift (Pérez, 2015). Surprisingly, ideology and expertise are often treated as mutually exclusive rather than complementary tools for achieving policy goals.

The "principal-agent model" argues that judicial appointments are driven by strategic considerations about candidates' preferences (Pollack, 2003; Elsig and Pollack, 2014). For example, studies of state appointments to the World Trade Organization's Appellate Body show the process is "deeply politicized" and far from a pure search for expertise (Elsig and Pollack, 2014, p. 3). Similarly, research on the International Court of Justice finds that international judges often follow the preferences of their appointing states (Posner and de Figueiredo, 2005).

A central question is whether judicial independence can coexist with renewable terms. Research on the European Court of Human Rights shows that judges' deference to home states significantly decreased after moving from renewable to non-renewable terms (Stiansen 2022; see also Voeten 2008, p. 417). In contrast, the CJEU uses secret voting to safeguard judicial independence (Dunoff and Pollack, 2017). Yet, existing research says little about alternative mechanisms for monitoring judicial behavior and performance, or how states balance ideological alignment with expectations of future influence.

The "trustee model," by contrast, emphasizes that judicial decision-making in courts differs from political institutions. International judges derive legitimacy from rational-legal expertise and the ideal of impartial dispute resolution. Influence is achieved through legal reasoning, making expertise a key asset. This model expects governments to prioritize professional legal merits and personal reputations over political criteria (Alter, 2008; Stone Sweet and Brunell, 2013). Accountability is considered minimal; as Alter (2008, p. 34) notes, tools like "not reappointing the Agent" hold little political relevance for shaping trustee behavior.

Scholars also highlight the decentralized nature of international judicial appointments,

where no single state controls the court’s ideological composition. Consequently, politically motivated selections are often futile. ”International judges are institutionally less subject to appointment politics than their domestic counterparts” (Alter 2008, p. 46; see also R. D. Kelemen 2012).

Contrary to current scholarship, we derive both selection criteria from the same assumption: selectors are policy-seekers. The ideal candidate is ideologically aligned with the selector’s agenda and possesses the authority to persuade other judges. Following the principal-agent model, we assume selectors view judicial appointments instrumentally. While the trustee model correctly identifies legal expertise as a source of influence, the two approaches are not inherently contradictory. Rather than studying *how* judges gain influence, we measure incumbent judges’ impact directly through the CJEU’s case allocations. We suspect governments do the same.

Theory and empirical expectations

Judicial reappointments aim to influence case law by selecting judges based on their ideology (”preferences”), and expected impact on the court’s decisions (”performance”). At the core of the selector’s problem is their limited information about judges’ qualities. Building on canonical insights from theories of Bayesian updating, we anticipate that selectors start with a prior belief about candidate qualities that they can update in light of judges’ records of service. The choice to replace a judge therefore hinges on the availability and relevance of new information – how well it predicts future influence (Ashworth, 2012).

Candidate judges vary in their ideological leanings, posing challenges for governments seeking to influence court decisions. Secret voting is a design feature intended to protect judicial independence, but it introduces moral hazard by limiting governments’ ability to monitor and sanction judges. To minimize policy drift, governments select nominees whose ideology

closely aligns with their own. When judicial votes remain secret, successive governments rely on the same ideological signals about judges. At the reappointment stage, a new government may even infer the incumbent judge’s ideology from that of the previous government. As a result, we expect that different governments will have different preferences over the same judge.

Hypothesis 1 *The probability that a judge will be replaced increases with the distance in preferences between the appointing and the reappointing governments.*

Beyond ideology, candidate judges also vary in their ability to exert influence on the bench. The extent to which governments update their beliefs about a judge’s capacity to impact outcomes depends on the relevance of available information. Specifically, procedural rules determine whether judges’ past roles serve as signals of their future influence. When influential positions – such as leadership roles or assignments to important cases – are distributed *selectively*, strong performance should reduce the likelihood of replacement. In contrast, positions acquired through predetermined procedures carry little weight. This distinction gives rise to two interlinked expectations.

Hypothesis 2a *The probability of a judge’s reappointment increases with their past performance on the bench, measured by their selection for positions of influence.*

Hypothesis 2b *The effect of performance on reappointment holds only when the court provides information that is relevant for judges’ future influence.*

By focusing on adverse selection, we model governments’ decisions as a function of qualities that are entirely or partially beyond judges’ control – namely, their ideology and impact. While prior research on renewable terms explores judges’ behavioral incentives, we instead examine governments’ incentives to select judges based on signals from the Court.

The theoretical framework also allows for inferences about judges' behavior under accountability. For instance, if hard work results in visible and lasting influence among a judge's colleagues, we can expect judges to exert greater effort in office. Conversely, in courts with strong seniority norms, high reappointment rates may occur without significant behavioral adaptations, particularly in voting patterns.

Lastly, positions of influence may be allocated indiscriminately – through lotteries, quotas, or other indiscriminate mechanisms. In these cases, judges whose preferences align more closely with the current government cannot distinguish themselves through performance. Yet, they still offer higher political rewards to the government by aligning more closely with its preferences. Put differently, governments cannot credibly commit to retaining judges unless their record of service provides information relevant for the next term (Fearon, 1999). In such cases, we expect judges to invest less effort, with court membership turnover closely mirroring government changes. As we will see, this has been an issue in the lower-level EU court, where case allocations follow a rota system (Zhang, Liu, and Garoupa, 2018, p. 13).

The Court of Justice of the European Union

Despite its status as the driving force behind the much-debated judicialization of politics in Europe (Pollack, 2003; Alter, 2009; R. D. Kelemen, 2011; Schmidt, 2018), 'there is shockingly little written on the process through which ECJ [CJEU] justices are appointed' (R. D. Kelemen, 2012, p. 50; see also Kenney, 1998, p. 104). Here, we connect the hypothesized effects of ideology and performance to the institutional features of the CJEU.

Ideology (H_1)

We have argued that the likelihood of replacing a judge increases as the preference distance between successive governments grows. This requires, first, that governments enjoy discretion

in their choice of judge, and second, that we identify the policy dimension they prioritize.

Each government has wide discretion in nominating its judge, with few strategic incentives to deviate from their ideal candidate. Judges are appointed through the unilateral nomination of a single government. While Member States formally appoint judges collectively ('by common accord'), in practice, this stage has been a mere formality (Dunoff and Pollack, 2017). Each Member State sends an equal number of judges to the Court, where they serve six-year renewable terms. Currently, this comprises nominations of one judge to the higher-level Court of Justice (CJ) and two to the lower-level General Court (GC). This gatekeeping power over judicial nominations allows governments to align appointments with their political preferences, making ideology a central factor in their decisions.

We further assume that the economic left-right dimension shapes the appointments of CJEU judges, aligning EU judicial politics more closely with the broader comparative EU literature (M. Gabel and Hix, 2002). Previous research, by contrast, has argued that Court-government relations are primarily influenced by attitudes toward European integration (Weiler, 1994, p. 523–24). One of the few studies addressing CJEU judge selection notes that 'some anecdotal evidence suggests Member States sought candidates who were perhaps less of a Euro-enthusiast in a general sense than their predecessors' (Kenney, 1998, p. 128). However, large- N studies of judicial decision-making have found mixed evidence for the influence of attitudes toward European integration, instead highlighting a left-right orientation (Malecki, 2012; Frankenreiter, 2017; Wijnvliet and Dyevre, 2021).

The left-right dimension is not only historically central to European national party systems but also highly relevant to EU policy. Questions about the role of the state in the economy and individuals' rights vis-à-vis the state lie at the core of the single European market. The CJEU's case law has frequently sparked controversy along the left-right spectrum. For instance, some view the Court's strengthening of individual citizenship rights as a progressive step toward embedded liberalism and expanded social rights at the international

level (Caporaso and Tarrow, 2009), while others criticize the 'Hayekian' bias in its rulings (Scharpf, 2010; Höpner and Schäfer, 2012; Schmidt, 2018). Furthermore, there is some evidence that the economic left-right dimension structures divisions among Member States in amici briefs (Larsson and Naurin, 2019), which in turn influence the Court's leadership decisions in case allocations (Hermansen, 2020). This emphasis on the left-right dimension ties directly to our hypothesis, which posits that ideological distance between governments affects the likelihood of judicial replacement.

Performance (H_2)

Unlike judges' votes, the Court is transparent about positions of influence, which allows governments to assess judges' past performance and their potential future impact. The allocation procedure determines whether this information is relevant to selectors. We first discuss the influence these positions confer and then examine how they are acquired.

Influential positions on the Court (H_{2a})

We consider two sets of positions commonly found in courts: the agenda setter in each case (the 'reporting judge') and the Court's leadership (K. Kelemen, 2016, p. 29-43).

The reporting judge in the CJEU – like the American majority opinion writer – wields disproportionate influence over the Court's decisions. As case manager, they leverage the information asymmetry between themselves and other judges. They first collect information and present the case to their peers. They later take a lead role in oral hearings, frame the debate during deliberations, and prepare the draft that serves as the basis for chamber discussions. The reporting judge also authors the final text of the judgment, and their identity is publicly disclosed. Their early involvement, as well as investment and expertise relative to their peers, means that the reporting judge's political preferences are often reflected in the ruling. However, judges never prepare cases against their own member state and their

presence in the chamber is far from guaranteed (Hermansen, 2020). By appointing judges who later author important judgments, governments may hope to influence the Court’s case law, but cannot expect their appointee to protect national interests in concrete cases (see also Cheruvu, 2024).

A second set of influential roles includes the Court’s top- and mid-level leadership positions. The top-level leaders—Presidents and Vice-Presidents—oversee the Court’s daily operations, preside over Grand Chamber cases, and represent the Court externally. They monitor rank-and-file judges and allocate key positions on the bench. Specifically, the President assigns judges to chambers and plays a role in matching cases with judges for each proceeding. In the higher-level Court of Justice (CJ), the President has full discretion to appoint the reporting judge. In the lower-level General Court (GC), the President assigns cases to chambers, while the Vice President reviews and authorizes final judgments before they are issued.

Mid-level leadership includes the Presidents of five-judge chambers, who hold significant influence over case outcomes. They preside over chamber deliberations, determine when debates conclude, and decide whether to call a vote. They are also responsible for ensuring consistency in the Court’s case law. Chamber Presidents typically participate in all panel deliberations under their purview, while rank-and-file judges often rotate. Their presence is guaranteed in all major cases, such as Grand Chamber deliberations. Finally, in the GC, mid-level leaders also select the reporting judge.

How positions are acquired (H_{2b})

The degree of peer selection for positions of influence has varied over time and between the two formations of the Court. We leverage this variation to test the intuition that the method of obtaining positions affects governments’ selection of judges in two different ways.

First, the rationale behind delegations to the reporting judge differs between the CJ and GC. Observers have noted that hard-working judges are often replaced at the whim of new

governments, resulting in higher turnover at the GC than at the CJ (Dehousse, 2011, 7-8 and 16-17). We argue that this is because judges' personal qualities are central to case allocations at the CJ, while effort – which a newcomer can also provide – plays a larger role at the GC. Accordingly, when analyzing judges' past performance, we examine the two formations separately, expecting an effect only in the CJ.

Specifically, allocations in the CJ follow a logic of selection, where the reporting judge enjoys considerable autonomy. Once the reporting judge is appointed, the President delegates all monitoring to the checks and balances of the General Meeting and chamber deliberations. Judges' competences are highly relevant to the cases they are assigned (Cheruvu, 2019). In office, case-by-case policy specialization authorized by the President allows some judges to exert disproportionate influence over certain issue areas (Hermansen, 2020). By appointing judges perceived as competent, governments seize an opportunity to shape case law. Past allocations in the CJ thus provide governments with relevant information about whether incumbent judges will continue to have influence.

In contrast, case allocations in the GC follow a logic of monitoring. Cases are assigned to chambers on a rotational basis, and the reporting judge is appointed by the Chamber President. The GC leadership remains informed throughout deliberations. Once the reporting judge prepares a final draft of the judgment, it is reviewed by the Vice-President, who provides feedback to the author, with the rest of the chamber's judges copied. In short, reporting judges in the GC are treated as more interchangeable, with less autonomy than their CJ counterparts. Their case assignments are less selective and therefore less indicative of future influence. To conclude, while judicial records from the two courts may appear similar, we only expect that past case allocations have a bearing on reappointments to the CJ.

Second, the procedure for acquiring leadership positions has varied over time. The President of the Court has always been elected by peers through a secret ballot for a three-year

renewable term. In the Court’s early decades, however, this was largely a formality, with appointments driven by intergovernmental bargains. Similarly, before 2003, presidencies of five-judge chambers were distributed on a rotational basis. Since then, these positions have been filled through competitive elections. Chamber Presidents serve three-year terms and can renew their mandate once. Crucially for our analysis, elected positions signal peer endorsement, unlike the non-elected roles of the old system. Thus, we expect that only selective leadership positions will influence governments’ decisions to replace judges.

Empirical strategy

Our empirical analyses draw on original data covering all 371 appointment decisions to the CJEU from its inception in 1952 through 2021. Judges exit the Court for various reasons. A substantial portion (51%) of exits coincide with the end of a mandate, often leading to reappointment. However, 37% of judges resigned before completing their term.

Our main analysis focuses on potential reappointments, retaining only the 268 exit decisions that occur after the expiration of a mandate. This focus is motivated by two reasons. First, we are interested in governments’ selection criteria but lack data on alternative candidates. For each decision, we measure the preference difference between the appointing and reappointing government. This approach tests whether two successive governments from the same Member State have different preferences regarding the same judge.

Second, we aim to isolate governments’ reappointment decisions from judges’ voluntary departures from the Court. To address this, we control for judges’ career stage and validate our findings with a placebo test. The placebo compares judges’ voluntary resignations during their term to governments’ reappointment decisions at the end of a term. We expect that our explanatory variables— government preferences and judges’ performance – will have no effect on decisions where governments are not involved (the placebo).

	Min.	1st Qu.	Median	Mean	3rd Qu.	Max.
Replacement	0	0	0	0.28	1	1
Preference distance (economic issues)	0	0.07	0.24	0.35	0.46	2.59
Preference distance (integration issues)	0	0.04	0.12	0.19	0.25	1.63
Preference distance (general left-right issues)	0	3.56	9.22	12.77	20.06	58.58
Performance (cases in larger panels)	-1	-0.07	-0.01	-0.03	0.05	0.74
Performance (cases of interest to the legal community)	-5.61	-0.74	-0.12	-0.2	0.25	4.55
Performance (selective leadership positions)	0	0	0	0.28	1	1
Non-selective leadership positions	0	0	0	0.26	1	1
Change of prime minister	0	0	1	0.52	1	1
Age	37.72	54.61	60.29	60.27	65.95	83.82
Length of tenure	1	3.87	6	7.8	11.18	32.1
Change in attendance	-49	-9	2	5.25	18	72

Table 1: Descriptive statistics

Variables

Our dependent variable, *Replacement*, captures all government decisions that could lead to a judge’s reappointment and flags those resulting in a replacement. As shown in Table 1, governments retain their judge in most cases (72%) when given the opportunity.

To test the expectation that the probability of replacement increases with the distance between successive governments (H_1), we place governments in a single policy space using party manifestos (Döring and Manow, 2018; Lehmann et al., 2023). *Preference distance - economic left-right issues* measures the absolute distance between the appointing and reappointing governments on economic left-right issues, calculated from factor scores estimated from the parties’ electoral manifestos. The bivariate statistics suggest that economic policy preferences influence reappointment: the median distance between governments that prefer the same judge is 0.17, compared to 0.41 when the incumbent is replaced (Pearson’s $R = 0.27$; $t = 4.45$). In the Appendix, we report two alternative measures of policy preferences: divisions along a general left-right axis and preferences regarding EU integration.

We test the hypothesis that judges’ performance reduces their probability of replacement (H_{2a}) using three measures of influential positions. For each, we compare the effects of selective and non-selective allocations (H_{2b}).

Performance - selective leadership positions identifies the Court’s President, Vice President, and Presidents of five-judge chambers after 2003. This variable is included in a separate model alongside an indicator for judges who held these positions before the reform

(*non-elective leadership positions*).

The reporting judge is the most influential member of the Court in each case. We approximate the impact of judges' case portfolios in two ways. *Performance - cases of interest to the Court* measures the proportion of a judge's cases decided by a chamber of more than three judges, while *Performance - cases of interest to the legal community* reflects the average number of academic annotations (i.e., journal articles) a judge's case portfolio has attracted since their last appointment. Important Court judgments are regularly debated in the legal community (Hermansen, Pavone, and Boulaziz, 2023), making these annotations indicative of the academic salience of a judge's portfolio. The general level of these two measures has changed over time and may vary with the length of each judge's term. To account for this, both variables are included as ratios of similar cases handled by the Court during the judge's term, allowing us to compare each judge's impact to that of their peers. This approach approximates the benchmarking that governments can reasonably perform.

Observers have pointed out that there is substantial variation in individual judges' influence on the Court (Krenn, 2022). This is reflected in our data. Moreover, performance varies more in the GC ($\sigma^2 = 0.84$) compared to the CJ ($\sigma^2 = 0.25$), suggesting that governments may find it easier to identify high performers in the GC. We have nevertheless hypothesized that the distribution of tasks in the GC limits the relevance of such information, as newcomers can achieve influence even in their first term.

The bivariate relationship between performance and a judge's replacement is as expected: as the ratio of cases of court interest in a judge's portfolio increases, the probability of replacement decreases in the CJ (Pearson's $R = -0.07$; $t = 0.36$), while it increases in the GC (Pearson's $R = 0.07$; $t = 0.51$). However, neither relationship reaches statistical significance.

Controls

We control for other factors that might affect either judges' decisions to leave the CJEU or governments' assessments of the incumbent.

First, judges might complete their term but choose not to continue. There are few positions more appealing to European judges than serving on the CJEU, and very few alumni pursue high-ranking, work-intensive jobs after their exit. Aside from government de-selection, the most likely reason for a judge to leave the Court is retirement. We therefore control for the judge's career stage and judicial behavior immediately prior to the reappointment decision.

Length of tenure approximates the judge's career stage. The average tenure upon exit is 10 years, with the median judge serving two 6-year terms. Similarly, we control for a judge's *Age* at the time of the reappointment decision. The average age of judges who left the court is 65 years. A judge reappointed at this stage would be 71 years old at the end of the next term, exceeding the retirement age in most Member States.

Second, we control for changes in a judge's investment in their mandate. A judge planning an exit may reduce their participation in Court activities. *Change in attendance* measures the difference in the number of deliberations a judge participated in during the year preceding the official exit decision, compared to the previous year.

Third, the models include an indicator for whether there was a change in the prime minister's party between appointments (*Change in PM*). This variable accounts for the possibility that the ruling party uses appointments to distribute spoils to political allies or coalition partners. A spoils system might influence both the preference distance between successive governments and the decision to replace an incumbent judge. New spoils are unlikely to be distributed unless there is a change in the prime minister's office.

Finally, we include an indicator for whether the judge held the position of President or Vice-President at the time of reappointment (*(Vice-)President*). These positions clearly

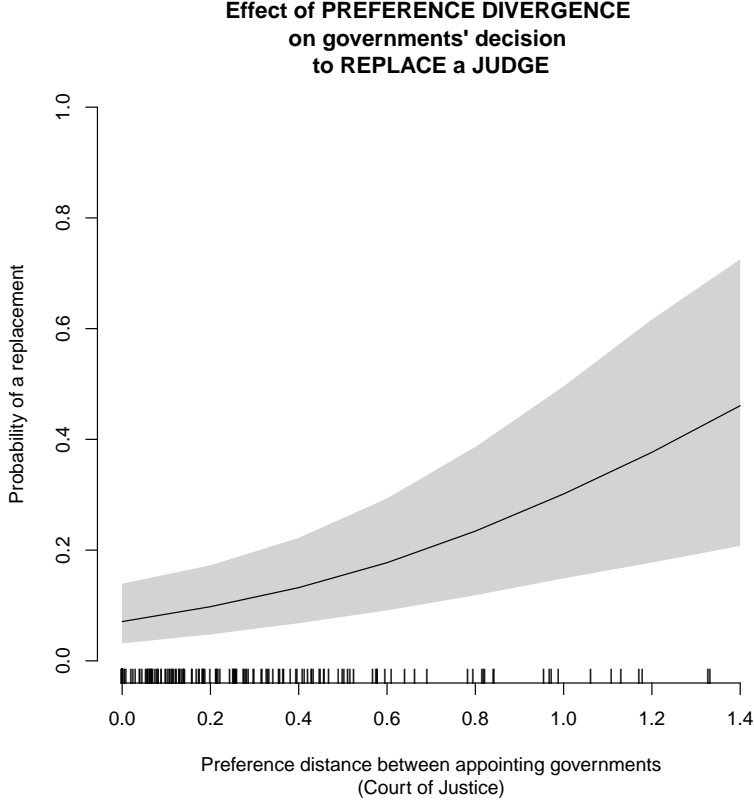

Figure 1: Predicted probability of replacement when there is a change in the appointing government’s economic left-right ideology.

confer influence, although the division of labor implies that these judges handle fewer cases themselves.

Given that our dependent variable is binary, we use a binomial logistic model. The results are obtained from Bayesian models with Markov chain Monte Carlo (MCMC) estimation. Some observations lack information on governments’ preferences, which are imputed in parallel with the estimation of the main model. In the Appendix, we confirm that the results are robust to alternative modeling strategies.

Results

The results reported in Tables 2 and 3 support our expectations.

The probability that a judge will be replaced increases as the political distance between successive governments grows (H_1). This effect is observed in both courts, as shown in Table 2. The magnitude of the effect is illustrated for the CJ in Figure 1 and is not trivial. Even a median change in government ideology increases the odds of a replacement by 53%. A typical shift from a conservative to a social democratic prime minister more than doubles the odds of a replacement. In the Appendix, we explore alternative measures of government ideology. Divisions along a general left–right dimension produce similar but more moderate effects compared to economic left–right issues. However, we find no support for earlier suggestions that preferences regarding national sovereignty are of relevance.

Table 2: Replacement of judge as a function of CASE ALLOCATIONS. Results from binomial logistic regression.

We have argued that governments favor judges who are likely to translate preferences into influence (H_{2a}). Additionally, governments base their decisions on relevant information about judges' past performance (H_{2b}). We find support for both statements.

First, handling high-impact cases as a reporting judge in the CJ – where such positions are selective – significantly reduces a judge's odds of replacement. This relationship holds regardless of how we measure the importance of their portfolios (Models 1 and 2). By contrast, we find no evidence of a similar effect in the GC, where reporting judges are

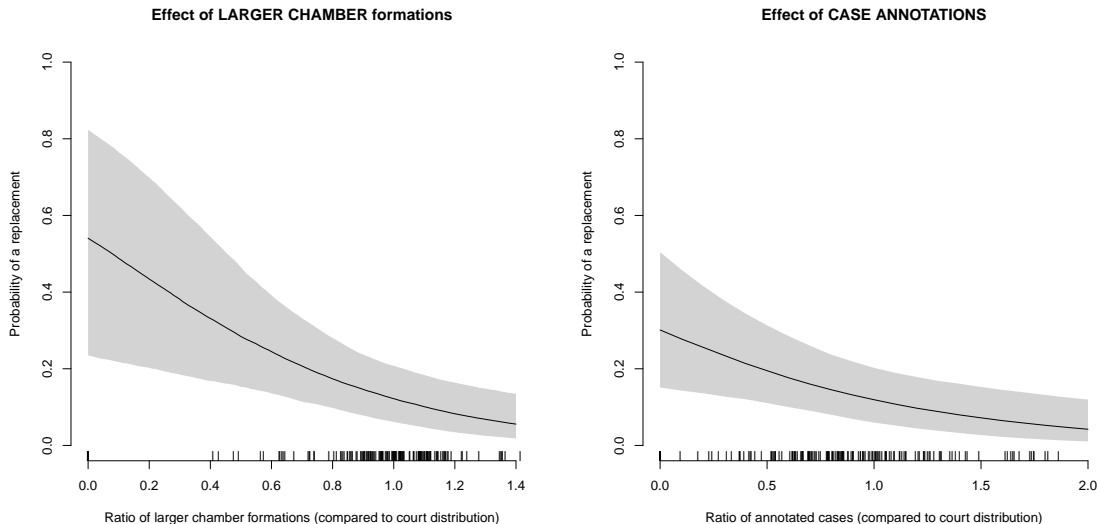

Figure 2: Predicted probability of replacement as a function of case portfolio among judges in the Court of Justice.

Hankla, 2008). Judging by their selection of judges, national parties in power care more about the contents of policies than the level of government at which they are made.

Second, the presence of easy-to-access, relevant indicators about judges’ performance makes accountability possible. However, the effect is conditional on the Court’s procedures for distributing influential positions. Only judicial records that reflect peer selection – and thus potential future influence – inform governments’ choices.

Third, selectors balance ideology and impact. Both criteria are important, and there are few indications that the effect of one influences the effect of the other. We show in the Appendix that including an interaction effect between the two yields a statistically insignificant effect.¹ The results thus suggest that governments may be willing to forego some ideological congruence to retain influence on the Court. Conditional on positions being selective, high-performing judges are partly shielded from politically motivated deselection. For example, when government preferences shift from a social democratic to a conservative prime minister, a *high*-performing judge has a lower probability of replacement (23%) than

¹Following a reasoning that governments discount performance for ideologically distant judges, we might have expected a positive interaction.

a *low* performer facing a more moderate (i.e., median) change in government preferences (34%). However, when preference distance becomes sufficiently high, performance can no longer compensate. A *low*-performing judge facing no change in government preferences has the lowest probability of replacement overall (15%).

Our results highlight the opportunity cost governments face when replacing an experienced judge with a newcomer. The Court tends to reserve the most influential positions for senior judges. For example, in our data, most high-performing judges were in their second term. Furthermore, case allocations allow judges to specialize, giving members disproportionate influence over certain policy areas – influence that governments would lose if the judge is replaced. The importance of seniority in gaining influential positions helps to explain why replacing a judge is relatively rare. Reappointing governments must weigh the immediate gains of selecting a new judge with preferences closer to their own against the probability that it may take several years before their investment pays off.

Robustness tests

The models provide a fair description of the data, with an in-sample correct prediction rate of 75%. They are also robust to several alternative specifications, including variation over time and between Member States (reported in the Appendix). However, three potential challenges to our claims merit discussion here.

First, it could be that our findings are not related to governments’ deselection of judges but are instead driven by the incumbent judges themselves. Table 4 reports the results of a placebo test in which we substitute occasions when a judge was replaced at the end of a term with instances where a judge left the Court for other reasons. As expected, we find an effect of ideology and impact in the CJ only when governments were involved in the exit decision. Career-related predictors, however, have a bearing on both types of exits: older judges, judges with long tenure, and judges whose attendance levels have decreased are more

Figure 3: The effect of elected and non-elected leadership positions on governments' choice to replace their incumbent judge.

likely to leave the Court.

Dependent variable: 'Replacement'	Potential reappointment (mandate expired)	Resignation (placebo)

Table 4: Placebo test on appointments to the Court of Justice: Reference level for both is instances where the term is expired and the judge is reappointed. Results from binomial logistic regressions.

Second, there is the possibility that governments use appointments to distribute political spoils. While this would align with the observed effect of ideology, it is contradicted by our findings on judges' performance. One might imagine two alternative rationales dominating judicial appointments: either governments distribute spoils (explaining the effect of ideology) or they select judges based on competencies (linked to performance). If this were the case, we would expect a negative interaction effect between preferences and performance. However, as already mentioned, the results do not support such a division. Both predictors retain their hypothesized direction across the range of the moderating variable. Although some judges may have been appointed on these grounds, this does not dominate reappointments in the EU.

Third, a challenge to the claim that deselection is the prerogative of governments comes from a recent reform of the Court. Since 2010, the appointment procedure includes an

intermediate stage in which new and incumbent nominees are screened by an advisory merit selection committee (the Article 255 Committee). Although the committee has warned that it can advise governments to deselect incumbent candidates, it has not yet done so (Panel, 2022, p. 10). The reform initially led some commentators to hope that the committee would check governments' political influence (Pérez, 2015). However, governments retained the prerogative to deselect any incumbent judge and are gatekeepers to new nominees. Others hoped for increased performance accountability (Dehousse, 2011). To flag manifest shirking, the committee has devised quantifiable measures of judges' case-management expediency but has avoided assessments that could be construed as political (7th Activity Report, 2022 pp. 12–14). Interestingly, there are indications that judges responded by increasing their efforts in office, particularly in the GC (Cheruvu et al., 2022), where, as we have shown, government-enforced accountability is minimal. We demonstrate in the Appendix that the emphasis on ideology and impact has – if anything – increased after the reform.

Conclusion

We have explored the argument that policy-seeking actors involved in judicial appointments base their decisions on both ideology and the predicted impact of candidates on a court's case law. Our study of EU governments' reappointment decisions to the CJEU demonstrates that transparency about judicial behavior alone is insufficient for accountability. Selectors must also perceive accessible information as relevant for a candidate's future influence.

Secret voting may protect judicial autonomy, but it does not shield judges from ideologically motivated deselection. Our analysis shows that a shift from a social democratic to a conservative prime minister more than doubles the probability of a replacement. With secret votes, judges have limited ability to avoid deselection by pandering to selectors' policy preferences.

However, because policy-seekers value impact, ideological deselection carries an opportunity cost that may benefit incumbent judges. Judges' personal standing and seniority likely enhance their ability to influence case law, leading selectors to trade some ideological proximity for retaining an influential judge. Our findings reveal that judges can be reappointed despite substantial shifts in government preferences if they hold central roles on the Court. The weight governments place on potential influence helps explain the high retention rate in the CJEU, even when ruling parties have the prerogative to nominate ideologically aligned judges.

The result is 'performance accountability': accountability based on perceived ability to impact case law. This concept implies a redistribution of power. From governments' perspective, performance accountability allows them to use appointments to exert more effective influence on judicial decision-making. However, it also makes governments dependent on the Court's own assessment of incumbent candidates. From judges' perspective, greater independence from governments fosters a new dependence on the internal hierarchy within the court, as many influential positions are controlled by the Court's leadership. Judges thus become agents of two principals: their leaders within the court and their political selectors in the Member States.

Importantly, we find that the way positions of influence are obtained determines the political rewards selectors can reap if they consider more than judges' ideological congruence. This insight has significant implications for academic studies of judicial selection and courts' institutional design.

First, our study establishes that a court's procedure for case allocation shapes selectors' beliefs about candidate judges. Delegating the preparation of cases to a single judge ("judge rapporteur") is a common feature in many courts (K. Kelemen, 2016). American scholars, in particular, have noted that if the majority opinion writer disproportionately influences court decisions, expectations about the qualities required for such positions should inform

the selection of Supreme Court judges (Lax and Rader, 2015). However, empirical evidence supporting this claim has been lacking.

Second, we encourage scholars of judicial selection to move beyond selection procedures and examine the incentive structures embedded in courts’ institutional arrangements. Judges persuade each other (Sunstein et al., 2006). In international courts, this implies that appointing a judge with the right qualities may give governments an edge in the competition for influence over court decisions.

This article offers new insights into the long-standing debate on balancing judicial independence, accountability, and transparency. We argue that judicial selection aims to shape case law through judges’ ideology and ability to exercise influence, and we have shown how courts’ internal organization can both constrain and empower judges. While renewable terms are often seen as a constraint on judicial independence, we demonstrate that selectors’ need for information also makes governments responsive to the court’s priorities.
